

TIPSOI

AI WORKFORCE ASSISTANT

Product Requirements Document

Document Version	1.0 — Initial Release
Status	DRAFT — Pending Engineering Review
Product	Tipsoi AI Workforce Assistant
Prepared by	Inovace Technologies Product Team
Date	April 2026
Tech Stack	Dify + Soniox STT + Claude/GPT LLM
Target Clients	1,200+ Organizations, 11 Countries

CONFIDENTIAL — Internal Product Document

1. Executive Summary

Tipsoi serves 1,200+ organizations across 11 countries with an AI-powered biometric workforce management platform. As the company scales toward \$4M revenue and prepares for US fundraising, a critical gap exists: customers and users must navigate complex multi-screen workflows, contact support for questions answerable by documentation, and have no intelligent interface to their own workforce data.

This PRD defines the Tipsoi AI Workforce Assistant — an embedded conversational AI system that allows HR administrators and workers to interact with Tipsoi using natural language (voice or text), get answers grounded in Tipsoi documentation and customer data, and trigger platform actions through a guided, safety-confirmed interface.

The system is built on Dify (open-source LLM application platform) with Soniox for voice transcription, self-hosted for data security, and integrated into Tipsoi's existing Spring Boot microservice architecture via REST APIs.

Support Deflection	Onboarding Speed	NRR Impact	Markets Served
40–65%of tickets auto-resolved	3x faster client activation	+8–12 pts through stickiness	11 countries 5 languages

2. Problem Statement

2.1 Business Context

Tipsoi operates in a market where service and manual labor employers — garment factories, construction firms, logistics companies, hospitals — have limited IT sophistication. Their HR admins are operational managers first, software users second. Tipsoi's platform is powerful, but its depth creates a steep learning curve that manifests as:

- High inbound support volume from users asking 'how do I' questions already answerable in documentation
- Long onboarding cycles when new client admins need hand-holding by Tipsoi's customer success team
- Feature underutilization where advanced capabilities like custom payroll rules, GPS tracking, and AI payroll agent remain undiscovered
- Language friction in MENA and Turkish markets where English-only UI reduces platform adoption
- Time zone gaps where clients in Istanbul or Dubai have no support channel outside Dhaka business hours

2.2 User Pain Points by Persona

HR Administrator (Primary User)

Current Way	New Way with Tipsoi AI Assistant
Opens 4–6 screens to find the attendance exception report	Asks: 'Show me workers with more than 3 absences this month'
Calls or emails support to understand a payroll rule configuration	Gets instant answer from AI grounded in Tipsoi documentation
Risks payroll errors from manual data entry across screens	Gets confirmation summary before any write action fires
Cannot access help outside Dhaka business hours	24/7 AI-powered first-line support in their language
Discovers new features only during training sessions	AI surfaces relevant features contextually during workflow

Frontline Worker (Downstream User)

Current Way	New Way with Tipsoi AI Assistant
Must go to HR office to check attendance record or payslip	WhatsApp/in-app: 'What is my attendance this month?' in Bengali

Discrepancy disputes require formal escalation process	Raises query directly via chat; HR receives flagged notification
No visibility into leave balance without asking supervisor	Instant self-service: 'How many leave days do I have?'
No access to Tipsoi system at all	Worker-facing interface via WhatsApp or dedicated mobile view

Tipsoi Customer Success Team (Internal User)

Current Way	New Way with Tipsoi AI Assistant
Answers same 15 questions repeatedly across 1,200+ clients	AI deflects repetitive queries; CS handles escalations only
Manually onboards each client admin with screen-by-screen training	AI guides new admins through setup contextually
No visibility into what clients are struggling with at scale	Conversation analytics reveal systemic confusion patterns
Support volume grows linearly with client count	Support capacity decoupled from client growth

3. Goals & Success Metrics

3.1 Business Goals

- Reduce customer support ticket volume by 40–65% within 6 months of full deployment
- Reduce average client onboarding time from current baseline by 50%
- Increase platform feature discovery rate (sessions engaging 3+ features) by 30%
- Expand effective market reach in Arabic, Turkish, and Bengali language markets
- Establish AI-native product narrative for Series A fundraising (May 2026 Demo Day)
- Generate proprietary behavioral data flywheel unavailable to hardware-first competitors

3.2 Key Performance Indicators

Metric	Baseline	Target (6mo)	Owner
Support ticket deflection rate	0%	>= 45%	CS Lead
AI response accuracy (human eval)	N/A	>= 92%	Product
Client onboarding time (days)	TBD baseline	-50%	CS Lead
DAU of AI assistant per client	0	>= 3 users/day	Product
Hallucination incidents (data errors)	N/A	0 undetected	Engineering
Average session resolution rate	N/A	>= 75%	Product
Worker self-service queries (Phase 3)	0	>= 500/month	Product
Net Revenue Retention impact	Baseline	+8–12 pts	Revenue

4. Jobs to Be Done

The JTBD framework identifies the functional, emotional, and social jobs users are hiring Tipsoi AI Assistant to do — distinct from features or user stories.

4.1 HR Administrator Jobs

JOB	Get an accurate workforce report instantly
When...	I need to present attendance data to my factory owner in 10 minutes
I want...	query attendance exceptions, absences, and late arrivals by voice or text without navigating multiple screens
So I can...	walk into that meeting with accurate data and look competent in front of leadership

JOB	Understand how to configure a complex payroll rule
When...	my company has a custom overtime policy that differs from the default
I want...	ask in plain language and get step-by-step guidance grounded in Tipsoi's documentation
So I can...	configure payroll correctly the first time without calling support or waiting for a response

JOB	Execute a payroll run with confidence
When...	it is the end of the month and I need to process payroll for 300+ workers
I want...	initiate payroll via a conversational flow that shows me a summary before I confirm
So I can...	avoid costly errors and sleep soundly knowing payroll was run correctly

4.2 Frontline Worker Jobs

JOB	Verify my own attendance record
When...	I think my attendance was marked incorrectly last Tuesday
I want...	check my own record in Bengali via WhatsApp without involving my supervisor
So I can...	raise a dispute with evidence and get it corrected before payroll closes

JOB	Know my leave balance before making a request
When...	I want to take leave next week for a family event
I want...	instantly know how many leave days I have available without asking HR
So I can...	make a confident leave request and plan my family commitments without uncertainty

4.3 Tipsoi Internal Team Jobs

JOB	Identify systemic product confusion at scale
When...	1,200+ clients are using the platform and I can not do individual check-ins with all of them
I want...	see aggregated conversation analytics showing which features, workflows, and questions come up most
So I can...	prioritize product improvements, documentation updates, and training investments with data

JOB	Onboard a new client without a dedicated training session
When...	we just signed 5 new clients through the BRACNet distribution channel in one week
I want...	rely on the AI to guide each new admin through setup steps contextually as they explore the platform
So I can...	activate new clients at volume without proportional CS headcount growth

5. User Stories

Stories are organized by Persona and Phase. Each story carries a Priority (P0 = must-have for Phase 1, P1 = Phase 2, P2 = Phase 3).

5.1 HR Administrator Stories

US-001 · P0 | HR Administrator

As a **HR Administrator**,
I want to ask the Tipsoi AI Assistant a product question in plain language and receive an accurate answer from Tipsoi documentation
So that **I can resolve doubts instantly without waiting for support and without leaving my workflow**

Acceptance Criteria:

- ✓ AI responds in under 3 seconds for KB queries
- ✓ Response cites the source document/section
- ✓ AI declines to answer questions outside Tipsoi domain with a graceful fallback
- ✓ Response is available in English, Bengali, and Arabic
- ✓ Conversation history persists within the session

US-002 · P0 | HR Administrator

As a **HR Administrator**,
I want to query my organization's attendance data by asking natural language questions like 'who was absent yesterday'
So that **I can get operational insights without running manual reports across multiple screens**

Acceptance Criteria:

- ✓ AI always fetches live data from Tipsoi API — never responds from memory or inference
- ✓ Results are scoped to the logged-in admin's organization only
- ✓ AI formats response as readable summary with option to download as CSV
- ✓ Query response includes timestamp and data freshness indicator
- ✓ Unauthorized data access across organizations is impossible by architecture

US-003 · P0 | HR Administrator

As a **HR Administrator**,
I want to speak my query in Bengali using voice input and receive a text response
So that **I can interact naturally in my native language, especially on mobile while managing floor operations**

Acceptance Criteria:

- ✓ Voice is captured via push-to-talk interface on mobile and desktop
- ✓ Soniox transcription achieves $\geq 90\%$ accuracy for Bengali and English in noisy environments
- ✓ Transcript is shown before submission so admin can correct errors
- ✓ Voice and text input modes are interchangeable within the same session
- ✓ Transcription latency does not exceed 2 seconds for utterances under 30 seconds

US-004 · P1 | HR Administrator

As a **HR Administrator**,
I want to trigger a leave approval action via the chat interface with an explicit confirmation step
So that **I can take operational actions faster without navigating to the leave management screen**

Acceptance Criteria:

- ✓ AI presents action as a button, not as direct execution from a text command
- ✓ Confirmation modal shows: Employee name, leave dates, leave type, remaining balance after approval
- ✓ Approval is only submitted after explicit button click on confirmation modal
- ✓ Action is logged with actor, timestamp, conversation_id in Tipsoi audit trail
- ✓ Admin receives success confirmation with the updated record

US-005 · P1 | HR Administrator

As a **HR Administrator**,
I want to initiate a monthly payroll run through the AI assistant with a pre-execution summary
So that **I can execute payroll with confidence, knowing exactly what will be processed before I confirm**

Acceptance Criteria:

- ✓ Payroll action requires secondary authentication (PIN or 2FA) before execution
- ✓ Pre-execution summary shows: number of workers, total payout amount, pay period, any flagged anomalies
- ✓ AI highlights anomalies (e.g., workers with zero attendance, salary changes) before confirmation
- ✓ Partial execution is not possible — all or nothing with clear error handling
- ✓ Post-execution: AI provides downloadable summary report

US-006 · P1 | New HR Administrator (Onboarding)

As a **New HR Administrator (Onboarding)**,
I want to ask the AI what to do first when setting up Tipsoi for my organization
So that **I can self-onboard without waiting for a training session from the Tipsoi team**

Acceptance Criteria:

- ✓ AI detects new organizations (< 7 days, 0 active workers) and proactively offers setup guidance
- ✓ Guided flow covers: device registration, worker enrollment, shift configuration, payroll setup
- ✓ Each step links to relevant documentation sections
- ✓ AI tracks which setup steps are complete and which remain
- ✓ Admin can exit guided flow and return at any time

5.2 Frontline Worker Stories

US-007 · P2 | Frontline Worker

As a **Frontline Worker**,

I want to message the Tipsoi assistant on WhatsApp in Bengali to check my attendance this month
So that I can verify my own records without going to the HR office, saving time and avoiding conflict

Acceptance Criteria:

- ✓ Worker authenticates via phone number OTP — no app installation required
- ✓ Response shows attendance for current month in Bengali with date-by-date breakdown
- ✓ Worker cannot access any other worker's data
- ✓ Attendance data is read-only for workers — no modification capability
- ✓ WhatsApp channel handles up to 1,000 concurrent worker sessions

US-008 · P2 | Frontline Worker

As a **Frontline Worker**,

I want to ask the AI about my leave balance and remaining entitlement
So that I can plan my time off confidently without creating administrative burden for my HR team

Acceptance Criteria:

- ✓ Response includes: total entitlement, used days, remaining balance, next accrual date
- ✓ Available in Bengali and English
- ✓ Worker can ask follow-up: 'Can I take 3 days next week?' and get availability confirmation
- ✓ AI does not submit the leave request — only provides information; request goes through HR

5.3 Internal Team (Tipsoi CS) Stories

US-009 · P1 | Tipsoi Customer Success Manager

As a **Tipsoi Customer Success Manager**,

I want to view an analytics dashboard showing the most common questions clients ask the AI assistant

So that I can identify product confusion patterns and prioritize documentation and product improvements

Acceptance Criteria:

- ✓ Dashboard shows: top 20 queries by volume, unanswered query rate, escalation rate, by client segment
- ✓ Filterable by country, industry, client size, and time period
- ✓ Unanswered queries exportable for documentation gap analysis
- ✓ Data refreshes daily; conversation content is anonymized for privacy

6. System Architecture & Technical Design

6.1 Architecture Overview

The Tipsoi AI Assistant is a layered pipeline where each stage is independently replaceable. Tipsoi's existing Spring Boot microservices remain the authoritative source of all data — the AI layer reads and writes through them exclusively, never maintaining its own data store.

Voice Capture	Mobile/web frontend — audio recorded via browser MediaRecorder API. Push-to-talk or tap-to-record. Bengali + English.
Transcription	Soniox STT API — noise-robust, Bengali/English, streaming. Falls back to Gemini Flash for admin desktop sessions.
Middleware	Thin Node.js/Spring Boot layer — injects org_id, user_id, session token. Routes to Dify Chatflow via REST POST /chat-messages.
Dify Chatflow	Knowledge Retrieval (hybrid BM25 + vector) → Tool calls to Tipsoi API → Claude/GPT LLM → Structured JSON response.
Tipsoi API Tools	GET /attendance, GET /payroll-status, GET /leave-balance, POST /approve-leave (confirmation-gated), POST /run-payroll (2FA required).
Response Rendering	Frontend parses JSON. Text rendered as chat bubble. action_intents[] rendered as buttons. Confirmation modal for all write actions.
Audit Trail	Every tool call + response + action logged to Tipsoi event store with actor, timestamp, org_id, conversation_id.

6.2 Dify Configuration

Chatflow Design

- App Type: Chatflow (supports multi-turn conversation + Knowledge Retrieval nodes)
- Knowledge Base: Tipsoi documentation — product manuals, device setup guides, payroll policy docs, FAQ, troubleshooting trees. Chunked at 512 tokens, 64 token overlap, hybrid BM25 + vector retrieval
- Retrieval Settings: Top-K = 5, Similarity Threshold = 0.65, Reranker enabled
- Tool Calls: Tipsoi API endpoints registered as Dify tools with OpenAPI spec definitions
- LLM: Claude 3.5 Sonnet primary (long context, strong Bengali instruction following). GPT-4o as fallback
- System Prompt: Strict persona — Tipsoi Assistant only. Hard-coded rules: never answer outside Tipsoi domain, always cite sources, always confirm before actions, never infer data — always call API

Multi-Tenancy Architecture

Since Dify is API-first, multi-tenancy is enforced at the middleware layer. Each API call includes `org_id` and `user_id` injected from Tipsoi's session token. Dify passes these as variables to tool calls, ensuring every API query is scoped to the authenticated organization. No cross-organization data access is architecturally possible.

6.3 Voice Pipeline

Soniox Integration (Primary)

- Use case: Mobile HR admins, field supervisors, factory floor environments
- Bengali + English mixed-language support with noise robustness
- Streaming transcription: real-time transcript display as user speaks
- Confidence score threshold: if < 0.80 , show 'Did you mean...?' correction UI
- Push-to-talk UX: hold button to record, release to transcribe and submit

Gemini Flash (Fallback)

- Use case: Admin desktop sessions, English-dominant queries, Soniox API unavailability
- REST call via Google AI SDK, no streaming — full transcript returned on completion

6.4 Safety Architecture

Hallucination Prevention

1. All data responses must originate from a Tipsoi API tool call — zero LLM inference on factual data
2. System prompt includes explicit instruction: 'If you do not have a tool result for this data, say you cannot retrieve it right now'
3. Responses that include numeric data (attendance counts, payroll amounts) must include the API call timestamp
4. Dify's knowledge retrieval returns source citations — all KB answers include document reference

Action Safety Gates

5. No action executes from a conversational text command — all actions render as buttons requiring explicit click
6. All write actions (leave approval, payroll run) require a confirmation modal with full action summary
7. Payroll execution requires secondary authentication (PIN) regardless of session state
8. All executed actions are logged to Tipsoi audit trail with actor, timestamp, `conversation_id`, and payload
9. Failed actions return clear error message with escalation path to human CS

Scope Guardrails

- Dify system prompt hard-codes domain restriction — AI refuses out-of-scope queries gracefully
- Worker-facing interface is read-only — no action buttons exposed to worker persona
- Role-based tool availability — workers cannot call admin API endpoints by design

7. Phased Release Plan

The phased approach is both a technical strategy and a trust-building strategy with Tipsoi's existing client base. Each phase proves safety before adding capability.

Phase	Timeline	Deliverable	Success Signal
Phase 1	Weeks 1–3	KB Q&A only — AI answers questions from Tipsoi documentation. No data access, no actions. Embed in admin dashboard.	Support ticket volume reduction visible. Admin satisfaction survey $\geq 4/5$.
Phase 2A	Weeks 4–5	Read-only data queries — AI fetches live attendance, payroll status, leave balance via API. Scoped per org.	Zero data access incidents. Query accuracy $\geq 92\%$ on human eval sample.
Phase 2B	Weeks 6–8	Action buttons — Leave approval, report downloads. Confirmation modals required. Audit trail logging.	First action executions. Zero unintended actions. Audit log 100% complete.
Phase 3A	Weeks 9–10	Payroll run via assistant — with 2FA gate, anomaly highlighting, pre-execution summary.	Payroll actions executed successfully. Zero reconciliation errors attributable to AI.
Phase 3B	Weeks 11–14	Worker-facing WhatsApp interface — read-only attendance and leave balance queries in Bengali.	Worker daily active users. HR reports reduction in manual attendance queries.
Phase 4	Month 4+	CS Analytics dashboard — aggregated conversation analytics for Tipsoi product and CS team.	Product team acts on first documentation gap identified from conversation data.

8. Synergy with Existing Tipsoi Systems

The AI Assistant is designed as a layer on top of Tipsoi's existing infrastructure — not a parallel system. Every capability depends on and reinforces existing Tipsoi components.

Tipsoi System	How AI Assistant Uses It	Value Reinforced
Spring Boot Microservices	All data queries and write actions go through existing REST APIs. AI is just another API consumer.	No data duplication. Auth and RBAC enforced at existing layer.
Biometric Face Recognition	AI can query device status, last sync time, recognition failure rates by voice query.	Makes device management accessible without navigating device dashboards.
AI Payroll Engine	AI assistant exposes the payroll engine's capabilities conversationally — custom rules, exceptions, run status.	Increases payroll engine adoption and reduces misconfiguration errors.
GPS TrackTag (future)	Field supervisors can query worker location status via voice: 'Who is on site right now?'	GPS TrackTag feature becomes accessible to non-technical supervisors.
Voice Work Log	Same Soniox STT pipeline used for work log feature extends to AI assistant. Shared infrastructure.	Reduces incremental cost; consistent voice UX across product.
MQTT / Kafka Event Stream	AI can subscribe to real-time events (device offline, sync failure) and surface proactive alerts in chat.	AI becomes the notification surface for operational events.
Offline-First Architecture	AI assistant gracefully degrades when edge devices are offline — shows last-known data with timestamp.	Maintains trust in data even in low-connectivity environments.
Multi-country Deployment	Dify's multi-LLM support allows language model selection per region. Arabic queries route to Arabic-optimized context.	True localization rather than translation layer.

9. Business Impact Model

9.1 Impact on Tipsoi as a Business

Support Cost Reduction

Industry benchmarks for well-implemented RAG chatbots on SaaS platforms show 40–65% ticket deflection. At 1,200 clients across 11 countries, even a conservative 40% deflection rate meaningfully reduces the headcount growth required to support client expansion. As Tipsoi scales through the BRACNet distribution channel and international markets, support capacity becomes decoupled from client count — a critical unit economics improvement.

NRR and Churn Reduction

Clients who interact with an intelligent assistant embedded in the platform daily develop deeper product dependency. Feature discovery through conversation (upsell surface) and faster resolution of operational pain points both contribute to higher satisfaction scores and reduced churn. The AI assistant directly supports Tipsoi's NRR narrative for investor conversations.

Competitive Moat

ZKTeco, Hikvision, and Dahua — Tipsoi's hardware-first competitors — offer no intelligent conversational interface. The conversation analytics flywheel (what 1,200+ clients ask about, struggle with, and discover) is proprietary signal that deepens with scale and cannot be replicated by device sellers. This is a genuine, compounding competitive advantage.

Fundraising Narrative

The AI assistant is proof-of-concept for Tipsoi's 'operating system for the physical workforce' positioning. US VCs evaluating the May 2026 Demo Day pitch will see not just a device+SaaS bundle but an AI-native platform that converses with workforce data. This validates the framing and supports a premium valuation multiple.

9.2 Impact on Customer Organizations

- HR admins spend less time on system navigation and more time on people management — the actual job
- Payroll accuracy improves through confirmation-gated flows that surface anomalies before execution
- New HR admins self-activate faster, reducing the cost and delay of internal training
- Multi-language support removes the English proficiency barrier for admin users in MENA and Bangladesh

- 24/7 availability eliminates dependence on Tipsoi support hours for operational decisions

9.3 Impact on Workers

The worker-facing WhatsApp interface (Phase 3B) represents the most socially significant impact layer. For garment factory workers, construction laborers, and service employees in Bangladesh and MENA — who have smartphones but no access to HR systems — this interface delivers:

- Transparency: workers can verify their own attendance record without depending on supervisor discretion
- Autonomy: leave balance checks and discrepancy queries happen on the worker's terms and timeline
- Dignity: removing the need to 'ask permission' to see one's own data is an empowerment shift
- BRAC Impact Narrative: this feature directly supports the impact measurement framework for Tipsoi's BRAC study — AI-enabled transparency for low-wage workers as a development outcome

10. Risks & Mitigations

Risk	Likelihood	Impact	Mitigation
AI returns incorrect payroll/attendance data (hallucination)	Low	Critical	All data responses require live API tool call. System prompt explicitly prohibits inference on factual data. Numeric responses include API timestamp.
Unintended action execution (e.g., payroll runs without confirmation)	Low	Critical	Actions only execute via explicit button click + confirmation modal. Payroll requires secondary auth. All actions logged to audit trail.
Cross-organization data leakage	Low	Critical	org_id injected at middleware layer from authenticated session token. Dify tool calls are scoped. Tested with penetration test before Phase 2A launch.
Low adoption by non-technical HR admins	Medium	High	Progressive disclosure UX — chatbot visible but non-intrusive. Onboarding nudge for new admins. Feedback loop: thumbs up/down per response.
Bengali STT accuracy in noisy factory environments	Medium	Medium	Soniox selected for noise robustness. Transcript preview before submit. Manual text fallback always available.
Client concern about AI handling payroll data	Medium	High	Self-hosted Dify deployment — data never leaves Tipsoi infrastructure. Clear messaging: 'Your data stays on Tipsoi servers.' Privacy policy updated.
Scope creep — AI answers out-of-domain questions	Medium	Low	System prompt hard-codes domain restriction. Tested with red-team prompts pre-launch. Graceful refusal message with redirect.
Dify platform dependency risk	Low	Medium	Dify is open-source (MIT); self-hosted. API surface between Tipsoi and Dify is a clean REST interface — replaceable with minimal migration effort.

11. Open Questions & Decisions Required

#	Question	Options
1	Which LLM provider is primary — Claude (Anthropic) or GPT-4o (OpenAI)?	Claude: better Bengali, long context. GPT-4o: faster, cheaper at scale.
2	Self-host Dify on existing infra or use Dify Cloud (\$59/mo)?	Self-host: max data control. Cloud: faster start, less ops burden.
3	Is Soniox the confirmed STT provider or is Gemini Flash sufficient?	Soniox: better for noisy environments. Gemini: simpler integration.
4	WhatsApp Business API provider for Phase 3B worker interface?	Twilio, 360dialog, or Meta direct. Each has different cost and setup complexity.
5	Which pilot clients participate in Phase 1 beta?	Choose 5–10 clients representing different industries and countries.
6	Will Tipsoi knowledgebase be maintained manually or auto-synced from docs system?	Manual: immediate. Auto-sync: requires tooling but stays current.

12. Appendix

12.1 Glossary

Term	Definition
RAG	Retrieval-Augmented Generation — technique that grounds LLM responses in a retrieved knowledge base, reducing hallucinations
Dify	Open-source LLM application platform used as the AI orchestration and knowledge base layer
Soniox	Speech-to-Text API optimized for multilingual, noise-robust transcription; primary voice input provider
STT	Speech-to-Text — the process of converting audio to written transcript
Chatflow	Dify's multi-turn conversation application type that supports knowledge retrieval and tool calling
Tool Call	A structured API call made by the LLM through Dify to fetch live data from Tipsoi's backend
Hallucination	An AI response that presents fabricated information as fact; primary safety risk in production
Org ID	Organization identifier passed with every API call to ensure multi-tenant data isolation

Hybrid Search	Combination of semantic vector search and BM25 keyword search for optimal knowledge retrieval
NRR	Net Revenue Retention — revenue retained from existing customers including expansion, churn, and contraction

12.2 Out of Scope (v1.0)

- AI-generated predictive analytics (e.g., predicting absenteeism) — future roadmap
- Agent-to-agent workflows between Tipsoi and external systems (ERP, banking) — future roadmap
- Fine-tuning LLM on Tipsoi-specific data — RAG is sufficient for v1.0 and avoids model training cost
- Voice output (text-to-speech) — voice input only for v1.0; TTS evaluated for Phase 4
- AI-generated employee performance reviews or HR recommendations — not in scope for compliance reasons

12.3 Document Revision History

Version	Date	Changes	Author
1.0	April 2026	Initial release — full PRD draft	Inovace Product Team

End of Document | Tipsoi AI Workforce Assistant PRD v1.0
